

This Heat Illness Plan is designed to build awareness and common practice within athletics and across the Irvine Unified School District. In addition to prevention and response guidelines, charts are provided to aid in determining when athletic activities should be altered and/or cancelled based on heat index readings. Site decisions based on local conditions will generally be the rule. However, in extreme heat or weather conditions, direction from district office staff may be necessary.

### **Prevention**

The best way to deal with heat illness is prevention. Prevention includes educating athletes and coaches regarding: recognition and treatment of heat illness; risks associated with exercising in hot, humid environmental conditions; the need for gradual acclimatization for a 10 to 14 day period; guidelines for proper hydration; and following practice/competition modifications based on the local temperature and relative humidity readings.

Heat stress problems occur when: 1) Prolonged perspiration causes dehydration and electrolyte depletion, and 2) External conditions, high air temperature and humidity, impair the body's natural mechanisms for dissipating heat. The heat stress problems seen in athletics are: Heat Cramps, Heat Exhaustion and Heat Stroke.

#### **Heat Cramps**

- Muscle twitching
- Muscle cramps
- Sweating

#### Treatment

- Stop activity and sit in a cool place
- Drink clear juice or a sports beverage
- Apply stretching and light pressure until cramps subside

# Heat Exhaustion

- Sweating profusely
- Weak and rapid pulse
- Cool and clammy skin (pale)
- Excessive thirst
- Dry tongue and mouth
- Fatigue (weakness)
- Shallow respirations
- Nausea/Vomiting
- Dizziness
- Elevated core body temp. (up to 104 degrees F.)

#### Treatment

- Move athlete to shady area or air conditioned environment
- Drink clear juice or a sports beverage
- Take cool shower/bath
- Remove excess clothing/pads

#### Heat Stroke (Medical Emergency)

- Possible absence of sweating
- Increase in pulse (strong and rapid)
- Hot and dry skin (flush skin color)
- Sensation of burning up inside
- Dizziness (mental confusion)
- Abrupt onset of headache, fatigue
- Labored respirations
- Nausea/Vomiting
- Unconsciousness
- Elevated core body temp. (105 109 deg F)

#### Treatment

- Call 911
- Cool Victim rapidly, using whatever methods available; apply ice packs to armpits, groin and neck areas, place victim in ice tub, use cool water towels
- Remove excess clothing/pads

\*Those supervising athletes should be able to recognize these basic signs and symptoms of dehydration. A conscious, cognizant, dehydrated athlete without gastrointestinal distress can aggressively rehydrate orally, while one with mental compromise from dehydration or gastrointestinal distress should be transported to a medical facility (activating EMS/911)

### **Preventing Heat Stress**

#### 1) Ensure pre-exercise hydration

Remember fluids throughout the day. Student athletes should have water bottle or sports drink with them throughout the day. They should drink up to 64 oz a day before athletic activity.

- Fluid replacement during exercise
   Fluid replacement should approximate sweat and urine losses and at least maintain hydration at less than
   2% body weight reduction. This generally requires 200 to 300 ml ( to 10 fl oz) every 10 to 20 minutes.
- 3) Post exercise hydration

Ideally completed within 2 hours, rehydration should contain water to restore hydration status, carbohydrates to replenish glycogen stores and electrolytes to speed rehydration.

#### 4) Acclimatization

Heat acclimation induces physiologic changes that may alter individual fluid replacement considerations. It is suggested that a graduated physical conditioning program be used and that 80% acclimatization can be expected to occur after the first 10 days. \*\* Sweat rate generally increases after 10 to 14 days of heat exposure, requiring a greater fluid intake for a similar bout of exercise.

# 5) Adequate rest breaks during exercise

Intensity of exercise increases metabolic heat production, which elevates core body temperature. Rest breaks every 15-20 minutes for 3-5 minutes can help lower core body temperature.

#### 6) Practice Modifications

Depending on temperature, practice modifications can assist with the body's ability to maintain safe core temperature and allow the body a better opportunity to cool during exercise.

# **Practice Modifications**

In determining safe athletic participation, the air temperature and relative humidity (RH) must be identified and used to determine whether or not practice/competition should be modified, postponed or cancelled.\*\* If the source of temperature readings is in question, it is advised to be conservative and follow the modifications of the higher zone/flag. Temperature measurement can be obtained by using a sling psychrometer, heat index monitor or from various internet weather-related sites such as: <a href="https://www.weather.com">www.weather.com</a>

Athletic Trainers will:

•

- Collaborate, communicate and advise when heat related conditions are not safe to conduct physical activity
  - Monitor temperature and humidity readings (by A.T. or assigned school personnel)
    - Temperature readings will be done on different surfaces (turf, grass, concrete, and gyms) and at approximately waist height
    - First temperature readings will be taken by at least 12 pm with a follow up reading by 1pm (to accommodate any transportation changes)
    - Temperatures will be monitored throughout practice/competitions

Coaches must insure that:

- When heat is a concern collaborate with the athletic trainer and administration on modifications that may be necessary
- Each athlete is allowed water at anytime
- Planned water breaks are placed on the practice schedule
- Allow athletes a minimum of 3 minutes during planned water breaks, to reduced metabolic heat production and encourage evaporative cooling.

- Remove helmets
- A shaded "cooling zone" is available
- Ice/cool towels

# Suggestions for accommodations:

- Move practice location (i.e. natural grass, or only on campus activities)
- Move practice indoors (as indoor temps allow)
- Move practice to morning or evening
- Equipment removal when not in live play (i.e. helmets)
- Allow for gradual addition of pads and intensity as the temperature changes

**Game modifications** may vary upon collaboration with Certified Athletic Trainers, Administration, Coaches and Game Officials.

\*\*Determinations and measurements of heat index will be site specific.
